

Pest Control Policy

Approved by: Nazmon Hannan

Last reviewed on: March 2026

Next review due by: March 2028

Aim

The goal of successful pest control in schools is to protect pupils and staff from noxious pests.

Context

Certain parts of Preschool, for example, kitchens and dining areas can provide ideal conditions for certain pests. Pests carry organisms that can be transmitted to humans, such as Salmonella bacteria, Leptospira (Jaundice), Gastroenteritis and Typhus etc. Children and infants and some vulnerable adults are more susceptible than the general public to the harmful effects from pests. Children and infants are more susceptible because of their immature immune systems and because they play on the floor and place objects and fingers in their mouths. Some vulnerable adults are at risk because their immune systems may have been chemically suppressed.

It is not a legal requirement in a school to have a pest control contract BUT it is a legal requirement that schools manage pest control.

Types of Pest

The following is a list of the common pests currently found in Great Britain:

- Ants • Beetles • Foxes • Bed Bugs • Cockroaches
- Houseflies • Rabbits • Wasps • Pigeons • Mice
- Rats • Woodlice • Moles • Moths • Fleas

Ants

The commonest species of ant is the black garden ant. Limited measures can be taken by facilities staff but professional pest control contractors should be brought in if large numbers of ants' nests are found.

Flies

Flies carry disease and tend to be around in the warmer weather in Spring and Summer. Flies are attracted to food.

Bats

Bats may only be handled by those licensed to do so. They cause no direct harm though their droppings may cause problems with smell and insect infestations. If bats are found on or near school premises, the local Environmental Health Officer should be contacted. The Bat Conservation Trust, can be contacted if help is needed to remove injured or dead bats.

Wasps, Bees and Hornets

Wasp nests are normally built in sheltered spots, with easy access to outside. They can be found in areas such as wall cavities, roof spaces and under eaves. They can grow to around the size of a football as the summer progresses. Only female wasps sting, but they can do so repeatedly. Honey bees live in colonies often greater than 30,000 in roof and wall cavities and hollow trees. They swarm in early summer. They

have a barbed sting and die once this is used but will sting when provoked. Professional vermin control contractors should be contacted to rid a school of wasp or hornet infestation. If there is a problem with honey bees, a local bee keeper or Environmental Health Officer should be contacted to relocate, not destroy, the nest as they are a protected species.

Cockroaches

There are two types of cockroach found in the UK; the Oriental cockroach and the German cockroach. Cockroaches will feed on almost anything from food to faecal matter. They are commonly found in kitchens and heating systems. They prefer warm moist conditions and they reproduce rapidly; a German cockroach can produce up to 240 eggs per month. They can spread bacteria and usually indicate that food preparation areas are not clean. Germs can be spread from the body of a cockroach or from their droppings. They can carry dysentery, gastro-enteritis, typhoid and food poisoning organisms. Contamination occurs when the cockroaches come into contact with foodstuffs.

Fleas

Fleas are external parasites, living off the blood of mammals and birds and include cat/dog fleas, human fleas and rat fleas. Beside the problems posed by the flea itself, they can also act as a vector for disease, for example, fleas can transmit a variety of viral and bacterial diseases to humans and other animals.

Mice

“House” mice are considered amongst the most troublesome and economically damaging rodents in the UK. They nest in the ground or in any protected location in nests constructed of shredded fibrous material such as paper. The female produces 5 to 10 litters per year, averaging five per litter.

Mice contaminate foodstuffs with their urine, droppings and hair and amongst the diseases they may transmit to humans are:

- salmonellosis (food poisoning)
- rickettsia pox
- lymphocytic

Mice also chew cables and wiring and this can cause short-circuiting and increase fire hazard.

Pigeons

Pigeons can carry psittacosis which can cause respiratory illnesses and flu-like symptoms, if humans are exposed to infected birds. Local authorities are empowered to control and destroy pigeons if they pose a threat to public health. Other measures can be taken to prevent pigeons nesting such as wires on window sills and netting across open pathways and courtyards.

Rats

Common rats live in any situation that provides food, water and shelter. The common rat is the most widespread of its species and is widely found in urban and rural areas. Their favourite foods are cereal products, although they will eat almost anything that humans eat. Rats can transmit several diseases to humans including Weil's disease which is a bacterial infection that attacks the kidneys and liver and can be

deadly.

Squirrels

The main threat from squirrels is that they enter roof spaces and chew woodwork, strip insulation from wiring and water pipes and drown in open water tanks causing contamination. Preventative measures should also be taken such as blocking gaps and entry holes with wire mesh and ensuring frequent inspection of roof spaces.

Foxes

Foxes are increasingly seen in urban and suburban areas as well as rural areas. The fox is primarily carnivorous, and they are highly effective scavengers finding waste in towns and cities plentiful. The law prevents the use of poisons or illegal traps or snares to control foxes and it is illegal to shoot them in urban areas. Foxes can carry toxocarasis, a parasitic roundworm which can be passed to humans. Infection is extremely rare and only affects around two people per million in the UK each year. Fox faeces may contain bacteria which can cause sickness in humans, so faeces should not be directly handled. Fox dens are established in January/February for cubs born in March. If a fox den is discovered in school grounds, the Environmental Health Officer will be contacted.

Premises

Premises often offer an ideal breeding ground for pests. Roof spaces and corners provide shelter from the elements. Old boiler rooms, over several degrees warmer than the rest of the building, stuffed with debris and insulating materials are also ideal places for pests to build their nests. Holes in external walls give easy access to sources of food and water and need a mesh barrier in place. Scheduled systematic cleaning of areas contaminated with food is an essential measure to reduce the risk of infestation.

Control Measures

- To stop pests getting into our kitchen at any time, keep the door closed at all times and no is ever left outside the cupboards.
- Special rodent deterrent plugs are installed in every room to keep any mice or cockroaches to enter the room.
- All cupboard, kitchen, office, staff toilet, cellar and shed has mouse traps with poison inside from the pest control.
- We look out for the evidence of the presence of pests including droppings, “chew-marks” on carpets and wiring, insect droppings and nests in all parts of our buildings, every morning using a torch.
- If any faeces found, cleared immediately and inform the pest control.
- Inside of the cupboards are cleaned every Fridays.
- A robust cleaning measures for the kitchen are in place and recorded on the tick chart. The kitchen staff cleans the floor daily.
- The premises are cleaned daily and a deep clean of the setting is undertaken every term.

- Cellar is kept free of rubbish and other items.

We aim to make sure that waste management is dealt with well. All waste bins from the rooms, kitchen and office bins are emptied every day.

Large external bins are kept away from the buildings (at the front of the preschool), emptied weekly.

Kitchen waste is not left in the kitchen and is also moved daily away from the kitchen to the front of the preschool.

We always try to use non-chemical methods before considering using pesticides Pest Control Companies.

Any reputable pest control firm will be able to eradicate pests/vermin and ensure that premises are clean and safe for reoccupation. The contractors will also ensure that any pesticides or other toxins used to eradicate infestation are safely administered without risk to users of the building.

Roles and Responsibilities

The Manager is responsible for pest control

- She will routinely check the preschool buildings for any evidence of pests.
- She will contact a pest control company if necessary.
- She will contact the Environmental Health Officer at the local authority if necessary.

If staff suspect the presence of pests, then they should inform the Manager Immediately

If an infestation is discovered:

- The affected areas will be closed pending the arrival of the local authority environmental health team member;
- No food or drink will be prepared nor should pupils and staff reoccupy the space until the pests have been eliminated, disposed of and the area thoroughly cleaned.
